

XPrivacyLua

Really simple to use privacy manager for Android 6.0 Marshmallow and later (successor of XPrivacy).

Revoking Android permissions from apps often let apps crash or malfunction. XPrivacyLua solves this by feeding apps fake data instead of real data.

Download and install apk

Install XPrivacyLua via [F-Droid](https://f-droid.org/en/packages/eu.faircode.xlua/) - <https://f-droid.org/en/packages/eu.faircode.xlua/>.

Enable module

You may receive a notification after the installation. Enable the module in [LSPosed](#) and enable any app you want to give fake data too. Restart your device.

Each new app installation must be manually activated in LSPosed! Do not forget this!

Settings

Click on the burger (top left) and mark **Notify on new apps** and **Restrict new apps**.

Restrictions

Check <https://github.com/M66B/XPrivacyLua#restrictions> what every single restriction does. It depends on your application whether you need to disable the restriction if you want to share the real data.

An example with a browser (Iceraven):

Read clipboard to copy and paste text, to search for something or similar.

Also remember to donate <https://lua.xprivacy.eu/>. It helps the developer and unlock some [additional features](#) as well.
